### REQUEST TO THE UN/FAO WORLD FOOD PROGRAM FOR ASSISTANCE IN A PROJECT FOR ACCHOMIC AND SOCIAL DEVELOPMENT

Country: LERANON

Title of Project: INTEGRATED DEVELOPMENT OF THE LEBANESE MOUNTAIN

ARHAS

Location: EIGH LAND AREAS

Date of request:

1969

Presented by: THE GREAN PLAN

### 1. Description of Project and the Role of W.F.P.

- a) The aim of the project is to increase the agricultural output of Lebanon by:
  - developing new arable land
  - developing abandoned agricultural land
  - intensifying agricultural production by developing infrastructures and ameliorating the cultural practices.

These actions are concentrated in the under privileged highland areas of the country, where obsolete cropping techniques are practiced by an impoverished rural population. Present cropping techniques, are contrary to basic methods of soil conservation and should be stopped promptly if the areas concerned are not to become for ever umproductive deserts of stones.

Vast areas of barren watershods have resulted in the depletion of the natural underground water reservoirs and in periodic floods that are washing away the remaining fertile soil cumulated at the bettom of the valleys. Massive rural migration is taking place at increasing rates.

The problem of rural migration, with the consequent abandoning of arable lands in the mountainous regions of Lebanon, started after World War I. It became a real exedus after World War II as a result of an abnormal development of the coastal cities, mainly Beirut which now accounts for two fifth of the total population of the country.

Statistical data on the overall population of the country and provisional figures to illustrate the increase in the rural migration are impossible to provide - since the last census dates back to 1932. Detailed secio-economic situations were available only since the French "Rissian IRFAD" called upon by the Lebanese Government, started its works in 1959. Even then detailed figures on internal migrations do not exist. However overall figures on urban V/S rural population are given as follows for the year 1959: (table I).

Table I - Rural V/S Urban Population in Lebanon in 1959(ostimates)(1)								
District Rural District Population Population Total								
Municipal Boirut			450 000	100	450 000			
Mount Lobanon	180 000	55,6	150 000	44,4	338 000			
North Lebanon	302 000	81,1	70 000	18,9	372 000			
South Lobanon	163 000	68 <b>,</b> 5	75 000	31,5	238 000			
Bokaa'	163 000	71,5	65 000	<b>28,</b> 5	228 <b>0</b> 00			
TOTAL	816 000	49, 25	810 000	<b>50,</b> 75	1 626 000			

<sup>(1)</sup> Besoins et Possibilite de Developpement du Liban - Mission IRFED.

LIBAN; Tome I - (1960)

The total area of Lobenon is 10 000 km<sup>2</sup>. The population density in 1959 was as high as 160 inh./km<sup>2</sup>. The rate of the population growth being 2.5%, the population density in 1975 will be 230 Inh./km<sup>2</sup> This figure does not include some 150 000 palestinian refugees and 200 000 syrians now permanently living in Lobanon.

This means that only in order to keep the same standard of living, Lebanon must, each 15 - years period, increase its national revenue by 50% (at constant prices). Moreover all the population pressure is concentrated in the urban coastal cities. For example the growth of the population of Beirut was as follows:

Table II - Population growth of Beirut					
Year 1922 1952 1960 1966					
Population	160 000(1)	296 000(2)	400 000 <sup>(1)</sup>	770 000 <sup>(3)</sup>	

Specific figures on rural migration are not available. However any tourist travelling through certain rural villages of the Lebanese highlands can easil notice that around 50% of the houses are either abandoned or even demolished.

<sup>(1)</sup> Mission IRFED - Bosoins et possibilités de Doveloppement du Liban - Volume annexe - (1960 - 1961).

<sup>(2)</sup> A.U.B - The City of Beirut, a Socio-Economic Study by Ch. W. Churchill - (1954)

<sup>(3)</sup> For Doirut and its suburbs - UNDP/GROEN PLAN - Present consumption of wood products and future requirements in Lebanon - (1966).

This drastic and rapid change in the geographic and social distribution of population of the country, not being parallelled by a change in the corresponding sectors of production, has resulted in the following:

- Impoverishment of the rural population with general discontent leading to social and political unrest.
- Expansion and proliferation of city slums with consequent moral and health degeneracy.
- Unemployment with waste of human and natural resources.
- Increased dependency on imported feedstuffs resulting in an over increasing deficit in the balance of trade.

The deficiency of the agricultural sector as compared to the other sectors of activity in Lebanon is evidenced when comparaison is made between table III and table IV.

Soctor of activity	19	64	19	965	Varia- tion
	Value	%	Value	5,6	65/64 %
Agricul ture	381.0	11.9	409•2	11.6	7•4
Energy& water	69•4	2.2	77.8	2.2	12.1
Industry & ·	410.6	12.0	462.4	13•1	12.6
Construction	178•3	5,6	200.4	5•7	12.4
Transport & communication	258•2	მ•1	290.8	8.3	12.6
Housing	250.0	7.8	269.1	7.6	7.6
Financial scrvices	108.0	3•4	124.5	3.5	15•3
Other services	271•5	8.5	320.2	9•1	17.9
Trado	1 028.2	32.1	085.2	30.8	5.5
Administration	244.8	7.6	283.8	8.1	15.9

One of the most salient facts, by comparing table III & table IV, is that 55% or more than half of the active population of Lebanon which is rural is producing only 40,9% of the national gross product.

<sup>(1)</sup> Republique Libanaise - Ministere du Plan - Direction Centrale de la Statistique - "Receuil do Statistiques Libanaises";

Volume 3 - (1967).

Table IV - Distribution of active population in % (in 1959)							
Sector of activity	Popu	lation					
1	Activo, perma- nent 450 000	Permanent and temporary 500 000					
Agriculturo Industry & handycraft Sorvices	49.0% 18.5% 32.5%	55•0% 17•5% 27•5%					

The per capita income in the agricultural sector is only 93 U.S. dollars, whereas the per capita income of the non agricultural sector is 743 U.S. dollars (G.P.P. at factor cost)(2).

The deficiency of the agricultural sector, besides causing an intelerable social disparity, has its bad reporcussion on the national balance of trade, thus rendering the political and occured situation of Lebanon of extreme procariousness. The future situation of likely going to amelierate.

### THE SITUATION OF AGRICULTURE IN LEBANON

ciato botwoon two situations of agriculture in the country: the Mountains Agriculture and the Plains Agriculture. The media relative to the Mountains situation are so specific and of different nature that a brief description of the land-water -climate relationships of the country together with the corresponding particulated social features is imperative:

To understand the Agriculture of Lebanon one needs to differen-

<sup>(1)</sup> Ministore du Plan - Receuil do Statistiques Libanaises - (Annoc 1967) - Vol 3.

Lebanon is essentially a mountainous country stretching

North-South along the eastern shores of the Mediterranean. It

consists of a coastal lain and two mountain ranges: the

Mount-Lebanon and the anti-Lebanon, separated by the Bokkaa valley

(or plain).

Table VI gives the areas of the different geomorphologic regions of Lebanon:

Table VI - Distribution of the Geomorphologic Regions of Lebanon (1)						
Région :	Arca in hectares	% of total area				
(a) Coastal plains (including hills up to 250 m and the lower part of the plain of Akkar up to 500 m)	130 000	13 %				
(b) The Bokkaa' Valley	150 000	14 %				
Total non mounta nous	280 000	<u>27. %</u>				
(c) Mount-Lebanon	250 000	54 %				
(d) Anti-Lebanon (Lebanese territory only)	187 000	19 %				
Total mountainous area	737 000	73.%				
Total area of the country	1 017 000	100 %				

<sup>(1)</sup> UNDP - FAO - Rapport final, Leb/78, "Development de la montagne Libanaise"

The coastal plain is an extremely narrow strip, except in the North where it widens out to form the plain of Akkar. The soil is alluvial, deep and fortile and benefits partially from the water streams running down from the adjacent mountains. The bulk of this water is lost to the sea during the winter season.

The Mount-Lebanon starts at the northern frontier of the country. It rises and widens into a dome reaching its maximum altitude of 3 083 m. South - East of Tripoli. Then it slopes down as it stretches southwards where it blends into the hills of Galileo. The summit zone of the southern half is made up by the streched crost of Jabal Niha (1 700m. - 2 000 m.) The western slopes of this chain falls in tiers towards the Mediterranean with frequent narrow garges opening out on the coastal strip. The eastern slopes are more uniform but steeper at high altitudes. They become gentler as they dip into the Bekkaa' valley.

The soil is mostly of calcaroous origin (Crotaceous and Jurassic) and of variable depth and fertility. The hydrology consists of numerous water springs and torrential streams many of which dry up during the summer.

Rainfall occurs only during the winter season ranging between 800 mm at low altitudes and 1 200 mm in the summit zone. The climate is mild except on the higher altitudes (1 000 m. and above) where snow falls every year. The vegetation is typically mediterranean.

The Anti-Lobanon from the orographic view point is roughly a roplica of Mount-Lobanon. But with rainfalls averaging between 300 mm and 400 mm por annum, falling exclusively in the cold season, Anti-Lobanon is in most cases a semi-arid zono of stones lying on oretaceous limestone.

The Bekkaa' Valley is a plain lying between the two mountain ranges at an average altitude of 900m. It is narrow in its southern part but widens gradually as it opens out northwards on the plain of Homs in Syria. It measures 120 kms in length with an average width of 10 kms. The alluvial soil of the Bekkaa' Valley is rather deep and fertile except in the North.

Two rivers originate in this valley near Baalbeck: The Orontes that runs northwards 15 km in the Lebanese territory and the Litani that runs southwards before it reaches the artificial lake behind the hydro-electric dam of Karaeun.

Annual rainfalls averages vary between 600mm. in the South and 300 mm. in the North. An underground water table lies at variable depths under some parts of the valley.

The most important fact to bring out from this brief description of natural agricultural media in Lobenon is that the mountainous part of Lobanon where agriculture is most difficult covers 73% of the total area of the country.

It is in these regions that are concentrated the Green Plan activities for agricultural development and where W.F.P. aid is mostly needed.

The following paragraph on farming methods describes the unfavorable conditions of the farrors dealing with Mountains agriculture.

#### FARMING PRACTICES IN THE MOUNTAINOUS REGIONS OF LEBANON

The hindering factors in farming practices in the Mountain area of the country may be grouped as to their nature into three groups: social factors, physical factors and economic factors.

The hindering factors of social origin are mostly due to demographic pressure. The population density today is as high as 200 persons per square kilometer. The total area presently under cultivation (as it will be shown later) is no more than 260 000 ha. The average holding per family in the Mountains is only one hectare. On a nation-wide basis the average area cultivated is a more 0.12 hectare per capita. This man/land ratio is far below the minimum required for a sound economy in an agricultural country like Lebanon. It is therefore imperative under such situation that:

- All possible arable land be put under cultivation
- More intensive cultural mothods be practiced.

The present situation is far from being so. Statistical figures computed by UNDP Project Lobanon - 6 show that (table XIII ) there are 70 000 hectare of abandoned old terraces and 390 000 of undeveloped land, potentially productive.

The hindering factors of physical origin are due to the broken topography of the land and its rockyness, to the concentration of rainfall exclusively in winter time and to the lack of permanent rivers for irrigation. Calcareous soil covers 3/4 of these areas. Generations of hardy Lebanese farmers spent incredible amount of time and energy to convert, manually, uncultivable steep slopes into terraces suitable to agriculture. The extent of these terraces that, once covered the whole country constitutes in itself a unique example in the world and, a testimony of man's struggle for life

But, today .... with the development of logistics and farm mocanisation, with the establishment of new agricultural policies in the industrialized countries to support their own agriculture, the Lebanoso farmer on his old fashioned, inaccessible, non irrigated terraces is no more able to face alone the world competition.

Refashioning his old narrow terraces into breader terraces that can be mechanized, supplying him with small tractor at moderate price, producing compost to substitute for the scarce and expensive barmyard nanure, constructing access roads, studying the world market prices tendencies for agricultural products in order to organize the production and the marketing, developing irrigation water ... these are the most important functions the Lebanese Government has entrusted the Green Plan with, in order to save the desperate situation of the Lebanese farmer in the Mountains.

And finally the lack of capital investment, mainly long term credit, has contributed a great deal to the pitiful situation of the mountain farmer. We shall see later on how the Green Plan and W.F.P. are going to help in this respect.

#### THE SITUATION OF THE RURAL POPULATION

The situation of the rural population was surveyed in detail in 1960 by the Ministry of Planning (Mission IRFED). A brief summary is given hereafter. For more details the reader is referred to the volume II of "Besoins et Possibilites de Developpement du Liban". - Mission Irfed - (Ministry of Planning).

IRFMD Survey pointed out major deficiencies in all aspects of the standard of living in the rural area:

The sanitary equipment is deficient in all rural areas. The number of doctors is very insufficient, hospitals and dispensaries are inexistent or far away from the reach of the Mountain people.

The standard of oducation is one of the most deficient in the rural areas. This is due to the fact that any person, having a minimum of education is migrating away from these areas where job opportunities of certain levels are inexistent, and also because of the poor quality of teachers and teaching. Leisures equally reflect the low standard of culture in the rural localities such as the lack of urbanisation in the villages (cinemas), the tendency for the traditional culture to disappear (festivities, displays, folk dances etc..), the lack of propensity of the people towards collective activities (sports, moetings etc..).

The social standard, also, is very deficient. It is characterized by an accentuated individualism that hinders many aspects of collective life such as cooperatives or associations. Family and political groupings however are exceptionally strong and, in some cases, constitute problems against progress.

Domestic water, electricity and communications (reads, mail, telephones) are generally deficient.

Housing, in some villages, is primitive (earth roofs) and unsanitary.

# THE JOINT ACTION OF THE LEBANESE GOVERNMENT AND THE UNITED NATIONS TO FACE THE DETERIORATING SITUATION OF THE LEBANESE MOUNTAINS

In order to face this deteriorating situation, the Lebanose Government has created several automonous offices in order to intervene promptly and efficiently. Among the most important offices recently established are:

- "The Executive Council for Major Engineering Works ", for roads and electricity.
- "The Litani River Office", for national hydro-electric works
- "The Office of Social Development", for rural animation
- "The Specialised Offices for price support such as the Wheat Office the Silk Office otc....
- And the "Office of Land Roclamation", known as the GREEN PLAN.

Parallol to these offices the Government of Lebanen has requested and obtained the aid of the Specialised Agencies of the United Nations in the following:

- " Underground Waters", Animal Health", "Mill: Production",
- " Crop Fortilization", "Podology", "General Agriculture
  Development and Afforestation", "Hydrology".

World Food Program aid was also requested and obtained but on a rather small scale. More details on this topic shall be discussed later.

# THE CRAIN PLAN AND THE UNDP/FAO PROJECT FOR MEE DEVELOPMENT OF THE LBANGSE HIGHLANDS

The GRAIN PLAN is an official automonous authority responsible for the development of agriculture in Lebanon through land reclamation and the other related activities. It is headed by an Executive Committee of three, a chairman and two members - appointed by presidential decree - under the trusteeship of the Minister of Agriculture. The appointment of the Executive Committee of the GREEN PLAN took place in September 1964. Six menths later, in February 1965, the GREEN PLAN was operating, aiming always on the long war at:

- Stopping or reducing the rural magnation to the absorbing capacity levels of the other sectors of production in the country.
- Encouraging a number of leader farmers to return to their villages and work their previously abandoned land.
- Increasing the per capita income of small farmer
- Reducing unemployment by creating new jobs in the rural areas
- Ameliorating the balance of trade by increasing the overall agriculture production of the country.

In order to reach this goal the GREJN PLAN has been entrusted with man; functions that can be grouped under the following major topics:

- 1- Applied research in the field of agricultural development
- 2 Economic surveys and agriculture market research
- 3 Execution of development works both on private, and on communal and government land.

## 1 - Applied research for agriculture development

The Lebenese Government realizing the importance of the fact that sound techniques are, bosides proper planning, behind the success of any development project have alloted a big part of its budget as well as one third of its technical personnel to the field of applied research and field trials. Moreover it has requested and obtained the technical assistance of FAO. On the 7th of February 1963, the UN/SF - FAO Project for the Integrated Development of the Lobanoso Highland started its operations. More than 60 technical reports on agriculture development were issued. It is on the basis of the technical reports prepared by FAO experts and their Lebanese counterparts in this project, that the GREEN PLAN works are being or will be executed, and it is for the sake of implementing these works that W.F.P. aid is now requested. The technical and economic justification for the works for which W.F.P. aid is requested hereby, shall be summarized later on. For the details, references is made subsquently to the corresponding technical reports prepared by FAO exports in collaboration with Lobanese counterparts.

# 2 - Economic surveys and agriculture market research Planning the agricultural production is the box t

Planning the agricultural production is the key to modern marketing. Following this line of thoughts, the Economic Section of the GREEN PLAN together with the French Bilateral Assistance (SEMA of Paris) have surveyed the tendencies of the potential market for Lebanon in more than 30 countries in West and East Europe, in the Middle East and in North Africa. Reference is made later on to the results of these studies.

3 - Exocution of development works, location, kind and amount of works, schedule of execution, technical and economic feasibility

Each category of those works shall be described in a separate paragraph hereafter. However, due to differences in the ways of budgeting these works and to differences in the procedures fellowed during the course of execution, these works shall be separated for convenience, into two main categories throughout this request manely:

- WORKS ON PRIVATELY OWNED LANDS
- HORKS ON COLLECTIVE AND GOVERNMENT LAND

Because sound agricultural development should be integrated both vertically and horizontally, the GREN PLAN Authority has been entrusted with a wide range of functions related directly and indirectly to farm development. For this purpose the GREN PLAN has two separate budgets:

A first budget of LL 30 000 000 (1) to be spent over a ten-years period (1964 - 1975), is to cover the following:

- Administrative expenses.
- The cost of planning desingning and controlling the development works.
- The cost of research and trials
- The cost of executing all works on non private land (roads, nurseries, afforestation etc...)

A second budget of LL 40 000 000 (2) to be spent over a tenyears period (1964 - 1975) for the purpose of providing funds intended solely for leans (cash or material or works) to the farmer, for the development of his privately owned farm.

<sup>(1)</sup> Decree No. 12216 of Feb. 22, 1963 and decree No. 13335 of July 10, 1963.

<sup>(2)</sup> Docree No. 13787 of Sept. 1963

### NATURE OF WORKS ON PRIVATELY OWNED LAND

The slopes of the Lebancso Hountains, in order to become suitable for agriculture, need to be treated physically. Following is a list of the physical land treatments and the other complementary works, the GREEN PLAN is helping (or planning to help) the farmers in their execution:

- 1- The removal of rocks with dynamite
- 2- The loosoning of the soil with a ripper
- 3- The shaping of the terraces and the leveling
- 4- The construction of internal farm read
- 5- The removal of stones
- 6- The construction of rotaining walls
- 7- The construction of water reservoirs and other irrigation devices
- 8- The construction of trollices for vincyards.
- 9- The fencing of the farm
- 10- The basic manuring
- 11- The preparation of soil for plantation and the plantation of trees
- 12- The mecanisation of cultural practices
- 13- Farm utility constructions (silos, warehouses, barns etc..)
- 14- The housing of the farmer

This terminalogy and the corresponding numbering will be used throughout this request. The same numbering will be used subsequently for references.

The procedure of executing the above mentioned works is as follows:

For works No. 1,2,3 and 4 the interested farmer is required to present a written request, in terms specified by the administration, furnishing all information on the actual state of his land such as: total surface area, whether it is irrigated or not, whether it is planted or abandoned, the type of works requested and the presence or absence of access reads.

Consequently, the GREEN PLAN will instruct one of its technicians to survey the land and establish a preliminary design of works actually needed on the land according to a plan ad hoc, which will inform the administration of the physical description of land, the type of soil, the extent of eresion, the area of the terraces, the possibilities of improving the irrigation system and finally, the estimation of hours of earth and rocks moving engines and the appropriate type of the engines needed to accomplish the specific tasks.

The administration of the GREEN PLAN, on the basis of this information and after preliminary analysis of the soil, and on the light of the results of market research studies, would advise the farmer on the nature of works needed and on the type of crops he should grow.

The GREEN PLAN then, with the consent of the farmer, draws an outline specifying the cost of each type of work to be carried out, as well as provision for expenses representing the cost of such complementary work as: construction of dry rocks retaining walls removal of stones and other finishing works. A map of the project is included with the outline.

In 1965 , the land owner was required to guarantee the payment of the loan (the 40 millions budget) by socuring a first mortgage on his land that is reclaimed by the GRAIN PLAN. In addition, he had to make a cash payment amounting to 18% of the total cost of the works.

The repayment of these debts is made without interest in ten annuities from the seventh to the sixteenth year. In the beginning of 1967 a new decree was issued ... authorizing the farmer to replace the land mortgage with bank deposits. In this case the money deposited by the farmer in the BECAIF<sup>(1)</sup> is blocked for n years at the end of which this deposit plus its compounded interest equals the total cost of land reclamation which is paid by the GREEN PLAN to the contractor of the earth moving heavy machinery immediately upon completion of the works on the private farm. The money paid by the GREEN PLAN to the contractor is drawn from the 40 000 000 LL budget lent to the GREEN PLAN by the Treasury for n years without interest.

The contractors are paid by the hour. The hours considered reinbursed by the administration are those registered on the record of a special service recorder fixed on each machine showing the time of operation with a normal output. A delegate of the administration is permanently present at the site of work.

Works No. 5 - 8 - 9 are manually done by the farmer and his family, with additional hired labor. No government aid is given here Works No. 6 are paid the same ways as works No. 1 to No. 4 but in this case the contractor is the farmer himself. Technical clearance of GREEN PLAN is requested.

Works No. 7.F the earth moving and earth reservoir the procedura is same as works No. 1 to 4. For construction of coment reservoirs

<sup>(1)</sup> Banque de credit Agricole Industriel et Foncier.

and the plastic lining of earth reservoirs the procedure is the sames as work No. 5. For the other irrigation devices such as deep wells, pumps etc.. the procedure will be the same as No. 1 to 4. Technical clearance of the GREEN PLAN is requested.

For works No. 10; the GREEN PLAN in collaboration with the Municipality of Boirut (who will be starting very soon the construction of two compost factories have come to an agreement for the sale of compost at low prices at the start, in order to extend the use of this fertilizer. Details on this subject are given subsequently.

For works No. 11, the farmer can obtain from the GRAEN PLAN selected varieties of seedlings at meminal prices.

### AMOUNT OF WORKS ON PRIVATELY OUTED LIND. POLE OF WFP AID

The amount and program of works are not determined according to the needs of the country, but according to the possibilities of the Government. Although the GREEN PLAN is the first and unique official authority in Lebanon to be budgeted for a 10-years period at once (the GREEN PLAN works being on top of the priority orde. list), its total budget (30 000 000 LL + 40 000 000 LL) - is far from covering the actual needs and potentialities of Agriculture in Lebanon. (Tables No. IX, X & Xl given the needs and potentialities of fruit and forage production).

The present budget of the GREAN PLAN is insufficient to carry out land improvement on all land capable of reclamation, (namely 270 000 ha). Even those to be reclaimed, will not be entirely developed. Hence the farmers will have to relay on their cwn resources for the completion of the works.

The ceiling of 10 000 LL (40 000 000 LL budget) allowed per farmer is not enough to complete the development of the individual farm. In many cases this amount of money (of which the farmer pays a part of it as discussed earlier) covers only the expenses of mecanical works (heavy machinery) and partial construction of retaining walls and of water reservoirs. Until the date of full production the farmer has to invest in his land two times and a half- on the average - as much as the contribution of the GREEN PLAN and fifteen to twenty five times as much as the WFP aid he new receives. A great majority of the farmers do not possess enough capital to finance the cost of supply of irrigation water or the price of a small cultivator or the cost of basic manuring.

Tablo VII gives, for a hypotetical average case, the total investment expenses on one hectare of Parming area.

Table No. VII. Investment Expenses on One Hectare of Farming

Area in the Mountain (in LL/ha) through the

Green Plan (1)

Itom	For basic land roclamation	Additional costs for irrigation, equipment etc.)
Earth and rocks moving	1 500 - 2 000	
Romoval of stones, leveling, walls	1 500 - 2 000	
Basic manuring	1 500	
Irrigation water (supply, storage, drainage		15 000
Installation of the orchard (first year)	800 - 1 300	
Consolidation (4 - 5 years)	4 000 - 6 000	
Mobilo equipment:		
- Irrigation		1 500
- Farm mochanization		800
Immobilo equipment (Farm utility construction)		2 000
TOTAL	9 300 - 11 300	19 300

It should be reminded here that one hoctare is the average holding in the mountain regions of Lebanon and that the ceiling of credit per farmer is only 10 000 LL.

<sup>(1)</sup> GREEN PLAN II - Proposals for the Extansion of GREEN PLAN 1969.

The investment expenses listed in table VII are quite high as compared to similar ones in the plain areas of Lebanon or in other countries. This — as discussed earlier — is due to the difficult media in which Mountain agriculture is situated, to the scarcity of easily reclaimed lands and, to the will of the Government to use maximum labor per unit area of land through intensive agriculture production (fruit orchards, silk, tobacco, irrigated forage production, vegetables etc..) Also is it fair to think here that any land reclaimed is gained — as in the case of the Poldors — for ever.

Therefore the role of W.F.P. can be summarised as follows:

W.F.P. COMMODITIES WILL BE DISTRIBUTED TO THOSE FARMERS OR GROUP OF FARMERS AND WORKERS WHO ARE ENGLE D IN LONG TERM DEVELOPMENT SCHEMES TO HELP THEM LIVE DECEMBLY DURING THE STARTING PERIOD WHILE INCURRING HEAVY INVESTMENT EXPENSES.

Payment modalities of WFP commodities for each particular kind of job will be discussed subsequently.

Inspite of the heavy initial investment, the economic rentability of a Mountain orchard is rather good as can be seen in table VIII. Once the initial major investment costs born by the individual farmer is overcome with the help of the GREEN PLAN and that of W.F.P., the farming enterprise can go by its own and no more GREEN PLAN or WFP aid will be needed.

Table No. VIII. shows that one hectare of land, if managed according to the GRIEN PLAN scheme and with W.F.P. aid, can provide a decent livelyhood to the average farmer's family in the Mountain i.e. around 4 500 LL/ha (1 ha = average holding in the Mountain).

Table No. VIII. Return to Family, Labor and Management for some Major Fruit Species (1) (in LL/ha)						
-			Slope			
Crops	Location	0 - 10 %	10-20%	20 %		
Peachos (Babcock	Mt. Lobanon	4 170	4 050	3 870		
Cherries (Bonny)	11 11	5 560	5 440	4 260		
Pears	Akkar	4 370	4 250	4 070		
Almonds	Ayali	5 200	5 080	4 900		
Apricots (Ajami)	Adren	5 950	5 830	5 650		
Tobacco (Bulgarian)	Mt. Lobanon	4 020	3 900	3 720		
Mulberry (Silk)	11 11	2 750	2 630	2 450		
Forage production	12 11	3 500	3 000	2 800		

As seen earlier (page 6) the farmer's yearly income before the GREEN PLAN intervent on was only 1 395 LL (income per capita (39) US dollars x number of persons in a family (5) x ratio US dollars/LL (3)

Figures of table IX computed by SEMA of France on the basis of the Markot Research Studies undertaken by the Green Plan economists in collaboration with French bilateral assistance experts show the potentials of experts of fruits on to the Middle - Eastern markets which now accounts for more than 80% of Lebanon's experts of fruit. The remaining 20% is for Africa East and West Europe.

<sup>(1)</sup> UNDP/SF/FAO - Project Lobanon 6-Rendements compares de quelques cultures au Liban - Juin 1966.

Table No. IX. Projections on Not Imports of Fruits in the Middle-East (1) (in 1 000 tons)							
Species	1965	197	5	1975	Increase		
	Net imports	Consumption	Production		1965–75		
Apples	81,6	308 0	94,6	213,4	161,5		
Other summer fruits	3,6	231,0	176,0	55 <b>,</b> 0	<b></b>		
Cranges	75,9	792,0	670,0	122,0	60,7		
Other citrus	14,9	313,0	270,7	47,3	217,4		
Grapes	- 3,1	550,0	547,5	2,5			
Almonds	2,5	27,0	12,5	14,5	480,0		
Bananas	23,7	193,0	104,8	88,2	272, 2		
Total fresh fruits	199,1	2 419,0	1 876,1	542,9	172,7		

On the basis of past trends, it is assumed that Lebanon's share of 1975 net imports of fruits in the Middle Eastern countries is around 70%. To the projected increase of Lebanese fruit export, another increase of domestic fruit consumption of 2 to 3% per year (due to population growth) is to be taken into consideration.

<sup>(1)</sup> Etude do la demande des fruit dans les pays du Moyen-Orient - 1968 - GRIEN FLAN/SEMA (Paris)

And finally, if we admit a rate of orchard replacement of the magnitude of 1/50 per year, the corresponding increase in orchard surface for the period 1969 - 1972 (1) should be as in table X.

Table No. X . Total Orchard Area to be installed in 1969 - 1972 (2)						
Catégory of orchards (all areas in hoc-tares)	1	Area already installed by the Green Plan 1964 to 1968	Area to bo installed 1969 to 1972			
Irrigated Min: Orchards Average: Max:	5 400 <b>8</b> 600 11 800	1 700	3 700 6 900 10 100			
Non irrigated Min: Orchard Average: Max:	9 200 13 100 17 000	3 800	5 400 9 300 13 200			
TOTAL (Averago)	21 700	5 500	16 200			

<sup>(1) 1972</sup> and not 1975: because 1975 production comes from orchards installed in 1972.

<sup>(2)</sup> GRIMN PLAN II - Proposals for the extension of the GREAN PLAN-

Table XI gives the new areas to be reclaimed for major annual crops for the period 1970 - 1975

Tablo No. XI	Tablo No. XI . Tronds in Supply and Aroas of Major Annual Crop in 1975 (1)

<sup>(1)</sup> GRZEN PLAN - Litani Offico: Outlook for the Plantation of Annual Crops - 1968.

The total area to be reclaimed in the period 1965 - 1975, in order to meet the needs of 1975 for only the major fruits and crops mentioned in table X and XI, is 16 200 ha (for perennials) + 8 450 ha (for annuals) = 24 650.

The financial possibilities of the GREEN PLAN will enable him for the period concerned to recalim only 10 000 ha.(1970 - 1974).

Table XII gives the time schedule for the execution of this works by the GRIAN PION.

The other complementary development works, discussed subsequently in this request are (in most cases unless otherwise specified) function of the annual areas to be reclaimed as specified in table XII.

Table No. XII. Time Schodule for the Extablishment of New Farming Areas by the GREEN PLAN 1969 - 1974							
Year	1969	1970	1971	1972	1973	1974	Total
Arca in ha	2 000	2 000	2 000	2 000	2 000	2 000	12 000

(1) It is estimated that 80% of the area of perennials and 30% of the area of annuals will occur in the Project's Meuntainous zones. The rest will occur on plain lands that do need physical treatment. These lands and parts of the meuntainous lands will be irrigated by the Litani Irrigation Scheme.

Table XIII. gives the pattern of the present land use in Lebanon and the possibilities for land reclamation. It shows the scarcity of good soil that can still be reclaimed and hence the necessity of concentrating upon intensive agriculture suitable to the mountainous conditions, namely fruit production.

Table XIII. Land Uso in Lobanon in 1967 (1)						
Catogorios	Area in ha	% of table area				
Cultivated soil	260 000	. 25				
Forests	70 000	7				
Bad forests	65 000	6				
Abandoned land (could be pro- ductif soil, old torracos)	70 000	7				
Unutilized soil (marginal and partially productif (2)	390 000	39				
Uncultivable soil (2)	135 000	13				
Roads and buildings	27 000	3				
Total area of Lebanon	1 017 000	100				

<sup>(1)</sup> FAO/FS: Project 78/LEB - Final Roport.

<sup>(2)</sup> Amonded definitions by GREEN PLAN.

# PROGRAM OF WORKS ON PRIVATELY OWNED LAND

The reader is referred to the paragraph on nature of works on privately ewned land for the terminology and means and ways of executing these works. Only works for which W.F.P. is requested are considered here.

Table No. XIV gives the program of work for those categories of physical land treatments requiring manual labor and for which W.F.P. aid is requested (works No. 5 & 6).

Table XIV . Program for Labor Intensive Physical Land Treatment:  Construction of Walls and Removal of Stones									
Yoar	1969	1970	1971	1972	1973	1974	To t		
Hoctaros treated with machinery	2 00	2 000	2 000	2 000	2 000	2 000	₩ <u></u>		
Construction of walls (m2)	2 000 00	000 000	2 000 000	2 000 000	2 000 000	2 000 000	12 00.		
construc- tion of walls (man/days)	2 000 00	2000 000	2 000 000	2000 000	2000 000	2000 000	12 00		
Removal of stones (man/days)	160 00	160 000	160 000	160 000	160 ccc	160 000	Ģ,		
Total man/days	2 160 0	160 000	2 160 000	2 160 00	2 160 000	2 160 000	12 5		

Following are figures and details on physical land treatment and the contribution of the GREEN PLAN to it:

- The average power of earth moving machinery is 180 HP. As explained earlier, these engines are operated by private contractors. They are paid in eash by the GREEN PLAN for the work they perform on the private land. (40 000 000 LL. budget). The farmer pays only a fraction of this cost (18% to 39% of the total cost).

This fraction of the cost, paid in chash by the farmer, is blocked at the BCAIF (1) for n years. At the end of n years this capital plus its compounded interest equals the amount of cash paid by the GRHAN PLAN to the centractor for the works performed on the private land. The GRIAN PLAN (the Government) looses only the interest of the menty.

- The average price per hour of the above mentioned engines is 30 LL (10 U.S. dollars).
- The number of hours of earth and rocks moving machinery is 70 hrs/ha.
- The average cost of physical land treatment (heavy machinery + dynamite is 2 000 LL/ha.)
- The average number of square meters of retaining walls is 1 000 m<sup>2</sup>/ha.

<sup>(1)</sup> Banque de Credit Agricale, Industriel et Foncier.

- The average amount of human labour for the construction of retaining walls is 1 man/day per n<sup>2</sup> of walls or 1 000 man/day per hectare.
- The average amount of human labour for the removal of stones is 80 man/days per hectare.
- The average cost of one man/day is 7LL.
- For wall construction, the contribution of the GREEN PLAN is similar to that of earth moving with heavy machinery except that the farmer in this case is the contractor and he hires the workers, and the GREEN PLAN pay the farmer 1,5LL per square meter of well constructed.
- No aid Whatsoever is given for the removal of stones.
- W.F.P. aid is requested as follows: 1 ration (1) per square meter of wall constructed and 80 rations per hectare for the removal of stenes. Based on table XIV, table XV & XVI give the financial program of physical land treatment and the corresponding W.F.P. aid requested.

<sup>(1)</sup> Daily family ration of WFP food as specified by FAO nutritionists and as described subsequently.

Total man/days	73 00	73 00	00	73	000	73	000	73	000	365	G'

Following are average figures and details concerning the construction of water reservoirs:

- The cost of storing one cubic meter of water in coment reservoir is 20 LL (10 LL for materials and 10 LL for hand labor)
- The cost of storing one cubic meter of water in concrete reservoirs in 15 LL (7 LL for materials and 8 LL for hand labor).
- The cost of storing one cubic meter of water in plastic lined earth reservoirs is 7 LL (3,5LL for materials and 3,5LL for hand labor)
- The cost of storing one subic meter of water in earth reservoirs is 1, 25 LL
- Cement and concrete reservoirs are almost always smaller than earth reservoirs, however they are usually fed by permanent sources of water and for the same capacity they can irrigate more area than earth reservoirs. Earth reservoirs are usually fed by winter rain water.

Table XVIII gives the financial program for the construction of water reserve rs and the corresponding W.F.P. aid requested.

- The contribution of the Government is

W.F.P. aid shall be desponsed at the rate of 2 ration/m3 of water stored in coment reservoir and  $\frac{1}{2}$  ration/m<sup>3</sup> of earth reservoirs.

Man/days	50 000	70 000	70 000	70 000	70 000	330 00

Following are explantory notes on the execution of wolls for irrigation purposes:

- Most of the wolls will occur in those areas of South Lobanon, on the hills surrounding the Bokka Valley and in the Akkar Plain that will not benefit from the national irrigation schemes.
- The area presently irrigated in Lolanon is 70 000 ha, 22 000 ha of which are devoted to fruit production.
- The national Irrigation Schemes plan to irrigate some 20 000 has starting on 1970 and ending on 1978 in the following main areas: Akkar, Zghorta, the Western Slopes of South Lebanon. The North and the South of the Bekka. This represents a big part of the Lebanese irrigation potential from rivers and the known underground water tables.

- The average cost of a well plus its pump in the South is 30 000 LL, in the Bekka 25 000 LL and in the Akkar Plain 15 000 LL. The difference in the cost price is mainly due to differences in the depth of the underground water tables.

Table XX gives the financial program for the execution of wells and the corresponding W.F.P. aid requested.

Tablo XX. Fin	encial Pi		r Wolls ar	nd Corrosi	oonding W.	F.P.

<sup>-</sup> Trellice density for ha varies between 600 and 1 000.

<sup>-</sup> The average cost of one trollice plus wires is 9 LL.

Table XXIV gives the areas planted with orchards the cost of consolidation (1) of these ordhards, and the number of farmers involved.

This kind of works is already covered by W.F.P. Project No. 438 effective as of 1969. The program given here in for the establishment of mountain orchards is a mere take over of Project 438. It is proposed that Project 438 will stop upon approval and implementation of the present request. Farmers engaged in the establishment of new orchards in the mountainous regions of Lebanon will have to start with unproductive expenses during a seven years consolidation period for orchards until the trees come into their initial production Aid from W.F.P. is requested only for a starting period of 3 years.

The number of farmers selected will be around 2 000 per year.

To be eligible for entry into this schome the farmer must: First, allet a minimum of 0.1 ha and a minimum of two hectares of his newly developed land for improved fruit production. Second, accept the everall guidance of the Green Plan experts in selecting the fruit tree to be planted and in the further development of the orchard

<sup>(1)</sup> All non investment costs necessary to bring the orchard into production. This period varies between 4 to 7 years according to species.

Tablo XXIV.	Program f		idation of	orchards a	and W.F.P.	
Yoar	1970	1971	1972	1973	1974	Total
Area of orchards	2 000	2 00	2 000	(1)	(1)	6 04
Farmers in- volved	2 000	2 00	2 000	.(1)	(1)	<b>6 0</b> 0
Cumulative No. of farmers	2 000	4 00	od 6 000	4 000	2 000	18 00
Cumulative cost of con-solidation(2)	2 000 000	4 000 0	6000 000	4 000 000	2 000 000	<b>18 00</b> 0 01
W.F.P.rations	500 000	1 000 0	od 1 500 <b>0</b> 00	1 000 000	500 000	4 500 O

Concentration of production and of future marketing operations is achieved as a result of the following measures:

- Reclamation has been done for larger plots belonging to several proprieter enabling the economic employment of resources, particularly machinery.

<sup>(1)</sup> No W.F.P. is requested for farmers who will start in 1979 & 1974 since distribution of W.F.P. commodities should stop by the end of 1974.

<sup>(2)</sup> See table VII.

-The Green Plan has undertaken a zoning of the mountains according to suitability of ecological conditions for the various fruit species involved. The zoning is based on the land capability map extablished under the UNDP/SF Project; Lebanon - 6. In each zone endeavours are made to plant a maximum of two or at the utmost three kinds of fruit trees, according to the suitability and in conformity with the findings of marketing studies.

Table XXXIX gives the annual distribution of tree-crops among different species and the number of each.

Farmers who plant during the usual planting season (November - February) will be eligible for a three years feed distribution period starting on the following first of March.

Table XXVII - gives the number and categories of tractors needed as the first stage for the introduction of farm machinery into the mountainous regions of Lebanon.

Table XXVII - Number and categories of farm tractors for the implementation of farm mechanization in the mountains of Lebanon (1)

Category	Namber	Use
8-13 IP caltivators	2000	7500 ha of mountain orchards
22-30 No track-type tractors	42.00	5000 he of mountains fruit crehards 1000 ha of mountain fruit orchards 1000 ha of tobacco on terraces 500 ha of vineyards on hills
25-35 EP four weels erticulated tractors	<b>50</b> 0	5000 ha of mountain fruit orchards 2010 ha of slive orchards on terraces
Total	3000	. 20000 ha

<sup>(1)</sup> Based on: UsDP project, Lebanon 6, "Mechanization of Mountain Agriculture in Lebanon" (June 1969)

Table XXVIII - gives the program for the implementation of the tractors mentioned in table XXVII

Table XXVIII - Program for the implementation of farm mechanisation in the mountainous area

Farmers involued	600	600	600	600	600	3000

Following are some explanations on table XXVIII. The total area mechanized in the 5 years plan is 20.000 ha. Priority order shall be given to farms developed by the Green Plan (approximately half of the tractors). The average unitary cost of the tractors plus the necessary attachments is as follows: 3000 LL. for the cultivator (two weels garden type

16000000

420000 | 2940000

8400

tractor) and approximately 10.000 LL. for the other types of tractors (18 - 40 m2).

Table XXIX - Gives the financial program for the implementation of farm dechanisation and the corresponding JPP, aid requested.

Table XXIX - Financial Program for Farm Mechanization and corresponding MFP. Ald Requested.

Farmers contribution

Cumulatire Nº of

farmers

Total JFP. rations

WFP. aid is requested for far-ers who will be owners of tractors and who follow the regular one year training course on "how to use and how to maintain farm tractors and farm machinery". WFP. aid is requested for each of these farmers for 350 days/year during the one year training course to compensate for their enforced stoppage of work and for another 350 days/year for the following year to enable them to face the first instalments on the price of the tractor.

3200000 | 6400000 | CADOGLE

600+1200 1200+1200 8200

S40000 840060

In table XXIX it is proposed that three groups of farmers (900 + 4200 + 1200) will enter the scheme of MTP aid - each group for a 2 years period. The Green Plan contribution to farm mechanization shall be in buying the tractors from the constructor in one deal and selling the tractor to the farmer against long term instalments with nominal interest or not interest at all.

Table XXX gives the program for farm atility constructions (works Ho 13) show as store houses, work shops, small barns, etc., and the corresponding WFP, aid requested.

Table XXX	- Program of Farm Utility Constructions and correspon-
ding W2.	pid raquested.

	1970	1971	1972	1973	1974	Total
N° of units	80	80	80	<b>6</b> 0	3C	400
Total capacity(n3)	40000	40000	40000	40000	40000	20600
Total cost (ML.)	12890000	1200000	1200000	1200000	1200000	<b>60000</b> 00
Total man/doys	200000	200000	200000	20 <b>00</b> 00	200000	1000000
FF. rations	200000	200000	200000	200000	200000	1000000
	:		ļ !		1	

The average volume of one unit is 12,5u X 10 m X 4 n = 500 mJ. Actual size of units may vary widely according to particular cases. No financial aid from the Green Plan is forseen for this type of construction. However construction plans and designs are offered by the Green Plan free of charge to the farmer. The commodities will be supplied to farmers upon completion of works and under the control of the Green Plan.

#### THE "SUN FLOWER" PROJECT:

The aim of this project is to replace the cultivation of Indian Hemp in the Northern part of the Bekka'a valley against other non prohibited crops, namely sunflower.

The Northern part of the Bakka'a valley (Baalbeck and Hermel distriction as somi describe plain (300 mm of rain) geographically isolated, and endowed with insignificant natural resources. The standard of living of this population is among the lowest in the country, and the meagre pastures that still exist in the area is of no help in reducing the ever increasing social disparity between this fraction of the population and the other relatively more priviliged fractions of the Lebanese population.

Urged by a bitter social situation and encouraged by malicious smugglers, a fraction of the inhabitants of the isolated villages in that part of the country were driven into the chltivation of Indian homp, one of the few crops that can grow under such difficult soil and climate conditions and the unique "cash crops" that can be grown successfully in the area without price support policy.

Roalizing the moral responsibility, Lobanon is assuming towards the consumers of such products in different parts of the world (Lebanon being not a consumer of Indian hemp), the Government of Lobanon under the guidance of the President of the Republic decided to eradicate the cultivation of Indian hemp, not only through enforcing laws (which did not give positif results in the past) but also through providing decent means of living for the concerned population.

The 21rst March 1966 the council of ministers nominated a special ... with the task of finding out the best solution to the problem.

The numbers of the committee are the Director General of the Internal Security Forces, the President of the Green Plan, and the Director General of the Ministry of Agriculture. The Director of the Wheat Office joined the Committee lately. Studies and trials started in April 1966.

The Committee then entrusted the Green Plan with the execution of the project. The "collaboration" of the armod unities of the internal security forces, although forceson, was nover needed. France's collaboration, through her bilateral aid field crops expert, was valuable. Among the different crops considered for the replacement of Indian hemp, Sunflower was selected because of the following reasons.

- 1 It can grow well under the difficult physical conditions prevailing in the area.
- 2 It is not unknown to the local population
- 3 It gives/rather non porishable product (sood or oil) that is imported/Lebanon in large amounts.
- 4 Its cultivation can be mechanised and its production easily controlled.

Table XXXI gives the costs of producing sunflower in the Baalbeck Hermel region.

Table XXXII	Production Costs of Sunflower in the Bekka'a Baalbock -
	Hermol Region (in LL/ha)

	Semi Irrigated	Dry
Fortilizers:		
- Nitrates 200 kgs/ha	50	-
- Phosphate 400 kgs/ha	56	-
- Handling of fortilizers	7	-
Rent of land and water	300	100
Plouphing & harrowing	40	40
Secding	17	15
Irrigating (16 times)	40	-
Harvosting	23	20
Threshing	5	5
Bagging	12	10
Transporting	10	10
Total	560	200

Following are some important data on sunflower cultivation:

- Somi irrigated production: 1 000 kgs/ha
- Dry production: 350 kgs/ha
- In 1966 67 68, seeds, fertilizors and threshing were offered free by the Government.
- In 1969 fortilizors were paid by the farmers.
- The rheat office buys the seeds at 45 pl/kg.

- The International price of sunflower seeds in 1968 was 41 pl/kg.
- . .- Table No.XXXIII gives a comparaison of cost and profit betwoon Sunflower and Indian homp.

Table XXXIII Comparative costs & profits of Sunflower V/S Indian Homp

### NATURE AND KIND OF WORKS ON MUNICIPAL AND GOVERNMENT LAND

Throc categories of these works are envisaged:

- 1) The construction of feeder rural roads
- 2) The production of seedlings
- 3) The production of compost

#### THE CONSTRUCTION OF FLEDER RURAL ROADS

The expenses of constructing these roads are entirely born by the Green Plan. The private owners must offer the land free, which becomes Government property through a presidential decree. Appendix No.

is an example of the final file for a typical feeder rural road.

The average cost of constructing such roads are detailed as follows:

a) Costs of earth moving + retaining walls + lateral ditches + pipes:

_					,
-	on earth lands	;	8	000	LL/km
	on semi-rocky lands	\$	10	000	LL/km
_	on rocky lands	<b>t</b> .	22	000	LL/km
_	Average	:	13	000	LL/km

b) Costs of stabilization + asphalting: 15 000 LL/km c) Costs of studies and designs: 2 000 LL/km d) Total average cost: 30 000 LL/km

The value of human labor in the construction of each square moter of feeder roads is given in the following table:

Kind of work	Lobanese Pounds /M <sup>2</sup>
Levelling	
Latoral ditches	0.50
Breaking the stones (including transport)	0.50
Lining with stones	0.35
Broaking stores into gravels	0.55
Spreading gravels & sprinkling with water	0.20
Spreading asphalt	0.30
Miscellaneous	0.30
TOTAL	3.00

The wage of one man/day being 7 LL, therefore 1/2 man day is needed for each square moter of rural read constructed.

Table No. XXXVII gives the program for the construction of Government farm road with the corresponding W.F.P. aid requested.

Table XXXVII . Program of Construction of Gvt. Farm

Roads and Corresponding W.F.P. Aid requested.

Appondix No.

gives the location of these roads.

#### PRODUCTION OF MEMDLINGS

According to the Green Plan market research studies already completed (around 35 countries were visited and studied in West and East Europe in North Africa and in the Middle-East) and according to data and information so far available, main conditions on the distribution of meedlings of fruits and other tree-crops to be planted in the areas developed by the Green Plan are formulated as follows:

The following factors that affect the profitability and market outlets of the various tree-crops have been considered:

- Comparative cost and roturn.
- Present and projected domand in the demostic market
- Present and projected import domand in the foreign markets.
- Lobanon's imports of thoo crops like almends, pistachios, apricots and its proparations, industrial grapes and olives.
- Potential and capabilities for processing

Table No. XXXIX gives the annual number of scedlings to be distributed annually in order to most the increase in demand for both local consumption and exports.

Table XXXIX . Annual Distribution of Fruit Seedlings in Lebanon To be produced Total Number Crop by the Green Plan 70 000 180 000 Table grapes 100 000 225 000 Industrial grapes 40 000 70 000 Citrus 100 000 300 000 Olivos 7 000 15 000 Pistachios 60 000 200 000 Almonds 20 000 45 000 Apricots 40 000 70 000 Cherries 40 000 15 000 Poars 6 000 15 000 Quinco 12 000 20 000 Plums 15 000 Miscellaneous 30 000 500 000 TOTAL 1 250 000

Table No. X gives the program of production of seedlings, the cost to government and the corresponding W.F.P. aid requested.

	_	soodlings roquestod	productio	n, and ec	rrospond	ing
Year	1970	1971	1972	1973	1974	Total.
No. of soudlings	500 000	500 000	500 000	500 000	<b>500 0</b> 00	<b>2 500 0</b> 0
Total cost (LL)	250 000	250 000	250 000	250 000	250 000	<b>1 250 0</b> 0.
Man/days	36 500	36 500	36 500	36 500	<b>3</b> 6 500	<b>182 5</b> 0.
W.F.P. rations	36 500	36 500	36 500	36 500	36 500	182 50

Following are some figures on the production of seedlings:

- One grape seedlings costs 0.5 LL (one of the cheepest). One olive seedlings costs 1 LL. One pistachie seedling costs 2 LL (one of the most expensive).
- Around 100 workers are working in the nurseries of the Green Plan.
- Farmors are requested to pay 10 to 20% of the cost of the seedlings.
- Forest scodlings are also produced in the Green Plan nursories.

  They are distributed free of charge or (for certain species) at nominal price.

The Green Plan on his four nurseries of 42 hectares (in Cheweifat, Tyr, Hadeth & Minich) will produce 500 000 seedlings. The rest is bought from private - Green Plan controlled nurseries or imported from Europe. Importation from Europe is restricted to new varieties that are not known to local nurseryment.

#### THE PRODUCTION OF COMPOST

Soils in Lobanon are very poor in organic matter (loss than 1%). The recent expansion of intensive cultural practices has resulted in an even greater shortage of organic fortilizers.

Table XXXV gives the total quantity of manure produced in Lebanon in 1966.

Table XXXV . Production of Manuro in Lobanon in 1966							
Category	Number	Tons of manuro/ year/head (1)	Total quantity (tons)				
Cattle	104 000	3	312 000				
Shoop	213 000	0•15	31 950				
Goats	442 000	0•15	66 300				
Pipos	9 000	3•5	31 500				
Horsos	3 000	1	3 000				
Mules	4 000	1	4 000				
Donkeys	37 000	1	37 00 <b>0</b>

Poul try	17 000 000	0.011	187 000				
		TOTAL	675 510				

<sup>1)</sup> with 35% moisture.

Table XXXVI gives the minimum requirements of manure in Lebanon in 1966 to keep the soil from degrading in the cases of major intensive crops only.

Table XXXVI . Minimum Requirement of Manuro in Lebanon in 1966							
Crop	Tons of manuro ( per ha.)	Area (ha)	Total quantity (tons)				
A. Irrigated							
- Fruit troos	20	29 499 .	589 980				
- Vogotablos	10	40 937	409 370				
B. Dry-Land							
- Fruit trees	10	34 634	346 340				
- Tobacco	10	6 603	66 <b>0</b> 30				
			1 411 720				

Comaparing figures of tables XXXV & XXXVI the deficit in the production of manure in Lebanon in found to be 736 000 tens/year.

Table XXXVII shows the potentials of production of organic fertilizers out of the refuse of the city of Beirut.

Table XXXVII . Possible Production of Co	ompost from the Refuse
1 - Boirut	Tons
Production of refuso/day	500 (1)
Production of fofuso/yoar	182 500
Production of compost:  a. Minimum (40% of refuse)  b. Maximum (65% of refuse)	73 000 113 000
2 Beirut & suburbs	
Production of refuso/dey(1)	1 000
Production of refuse/year	365 000
Production of compest	
a. Minimum (40% of refuse) b. Maximum (65% of refuse)	1.;6 000 237 250

<sup>(1)</sup> Estimations of the Municipality of Beirut.

Figure of table XXXVII, shows that the production of compost out of the refuse of Beirut will not satisfy the present country's need for organic matter but will fill an important gap and serves as a pilot project for Lebanon as well as for all the Middle East, thus aponing a new era of hygonic refuse disposal and a new and cheap source of erganic matter badly needed for the Lebanese Agriculture.

The project of installing two plants in Beirut for the production of compost is quite advanced. Auction has taken place in April 1969.

This project will be executed jointly by the Municipality of Beirut and the Green Plan. The municipality of Beirut offers the land and the erection of two plants, collects the refuse and delivers it to the plants. The plants which are the property of the Municipality will be internally managed by the constructor under the direction of the Municipality. The Green Plan will be responsable for the sales of the compost to the farmers at encouraging prices for a starting period of 4 years.

W.F.P. commoditios will be given to 2 000 garbage collectors of the Municipality against a small reduction in their salaries. The mency thus saved will serve to lower the selling price of the compost.

Tables XXXVIII . gives the approximate cost of building one of the two plants with a capacity of 400 tons/day.

Table XXXVIII . Approximate Cost of I	Bairut Compost Plant. (1)
Item	Cost in L.L
Land (50.000 m <sup>2</sup> x 60 LL)	3 000 000
Fixed installation and machines	8 000 000
Mobile machines	1 000 000
Buildings + warchouso	1 500 000
Miscellaneous	1 000 000
TOTAL	14 500 000

Tablo XXXIX gives the cost of depreciation, management and marketing.

<sup>(1)</sup> These figures are based on offer transmitted to the Municipality of Beirut during an old auction.

Table XXXIX . Annual Cost of Depreciation , Management and Marketing in a 400 tons/day Compost Plant

			]
	Years	Total Cost (LL)	Annual Cost
- Depreciation			
- Fixed installation	15	8 .000 000	5 333 333
- Mobile machine	7	1 000 000	142 857
- Civil engineering	15	1 500 000	100 000
- Miscellaneous	10	1 000 000	100 000
TOTAL			-5 676 190
2 - Running Cost - Electricity - Fuel			250 <b>6</b> 00 100 000
- Replacement parts			300 000
- Personnel			150 000
TOTAL			- 800 000
3- Marketing			- 200 000
4- Miscellaneous	(10% of run	ning Cost+Marketing	100 000
5- GRAND TOTAL			6 776 190

In the case of full production, the cost of producing one ton of compost will be:  $\frac{6\ 776\ 190}{365\ 400}$  = 46 LL/Ton of compost as compared with 100 LL/Ton of barnyard manure. (both prices at supplier's site)

Table XL gives the amount of W.F.P. ration's requested.

<u>-</u>				- <del></del>

W.F.P. Rations	720 000	720 000	720 000	720 000	2 880		

The estimated value of 720 000 N.F.T. rations being 1 440 000 LL, the price of one ten of compost could be reduced by almost: 5 LL if the daily production of compost is 400 tens and by 2.5 LL if the daily production of compost is 800 tens.

It can be said that this reduction in price is approximately equivalent to the cost of handling and transporting the compost from Beirut to the farmers orchard.

- 3. a) The Government will designate the Executive Committee of the Green Plan to execute the project on behalf the Government. It is a semi-autonomous agency of the Government.
  - b) (i) The President of the Green Plan Executive Committee will serve as channel of communication between the Government and W.F.P. in respect to policy matters.
    - (ii) (iii) In regard to details of operation the Co-Manager of the Special Fund Project for the Development of the Lebanese Mountains will be designated as the channel of communication.
  - . a) Food habits are quite similar to these of the other mediterranean countries except that a part of the population does not eat pork or pork derivatives.
    - b) Beneficiaries will receive these commonities as an addition to their regularly consumed diet.
    - c) Hard wheat, vegetable oil, dried milk, canned meat and cheese are requested. No change forseen during the period of assistance.

      Wheat is to be received in 50 kilos strong jute bags, other commodities in the smallest available containers.
